

.. . .

ABSTRACT OF THE DISCLOSURE

The invention relates to a device used to convey objects, comprising a rotating support which includes a transfer arm (14), wherein the transfer arm (14) consists of a plate (16) and a gripper head (20) which can bear at least one object and which is slidably mounted in relation to the plate (16) according to a direction (B0) wherein the gripper head (20) is coupled to a slider (22) sliding in a slide rail (24) fixed to the plate (16), and comprising a first and second cam system in order to respectively slidably drive the gripper head (20) and to pivotally drive the plate (16), according to the angular position of the arm (14) around the axis of rotation of the support, characterized in that the slider (22) is constructed as a single part which has an overall rail shape, wherein the profile of the slider (22) is complementary with respect to the profile of the slide rail (24), and in that the gripper head (20) is fixed such that it overhangs on the distal end section (89) of the slider (22)
